

Section 3.4

3. Write the complete solution as \mathbf{x}_p plus any multiple of \mathbf{s} in the null space:

$$\begin{bmatrix} 1, & 3, & 3 & | & 1 \\ 2, & 6, & 9 & | & 5 \\ -1, & -3, & 3 & | & 5 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 3 & | & 1 \\ 0, & 0, & 3 & | & 3 \\ 0, & 0, & 6 & | & 6 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 3 & | & 1 \\ 0, & 0, & 1 & | & 1 \\ 0, & 0, & 0 & | & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 0 & | & -2 \\ 0, & 0, & 1 & | & 1 \\ 0, & 0, & 0 & | & 0 \end{bmatrix}$$

pivots = x_1, x_3
free variables = x_2

Let $x_2 = 0$, then $x_1 = -2$ and $x_3 = 1$
Therefore, $\mathbf{x}_p = (-2, 0, 1)$.

If $x_2 = 1$, then $x_1 = -3$ and $x_3 = 0$.
Therefore, $\mathbf{s} = (-3, 1, 0)$.

The complete solution of this system of equations is then:

$$\begin{bmatrix} -2 \\ 0 \\ 1 \end{bmatrix} + c \begin{bmatrix} -3 \\ 1 \\ 0 \end{bmatrix} \text{ for any } c.$$

4. Find the complete solution to

$$\begin{bmatrix} 1, & 3, & 1, & 2 & | & 1 \\ 2, & 6, & 4, & 8 & | & 3 \\ 0, & 0, & 2, & 4 & | & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 1, & 2 & | & 1 \\ 0, & 0, & 2, & 4 & | & 1 \\ 0, & 0, & 2, & 4 & | & 1 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 1, & 2 & | & 1 \\ 0, & 0, & 2, & 4 & | & 1 \\ 0, & 0, & 0, & 0 & | & 0 \end{bmatrix}$$

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

$$\begin{bmatrix} 2 & 6 & 0 & 0 & | & 1 \\ 0 & 0 & 2 & 4 & | & 1 \\ 0 & 0 & 0 & 0 & | & 0 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 3 & 0 & 0 & | & 0.5 \\ 0 & 0 & 1 & 2 & | & 0.5 \\ 0 & 0 & 0 & 0 & | & 0 \end{bmatrix}$$

pivots = x_1, x_3
 free variables = x_2, x_4

Let $x_2 = 0$ and $x_4 = 0$; then $x_1 = 0.5$ and $x_3 = 0.5$
 Therefore, $x_p = (0.5, 0, 0.5, 0)$.

Let $x_2 = 1$ and $x_4 = 0$; then $x_1 = -3$ and $x_3 = 0$
 Therefore, $x_{n1} = (-3, 1, 0, 0)$.
 Let $x_2 = 0$ and $x_4 = 1$; then $x_1 = 0$ and $x_3 = -2$
 Therefore, $x_{n2} = (0, 0, -2, 1)$.

Then, $N(A) = c_1(x_{n1}) + c_2(x_{n2})$.

It then follows that the general solution is:

$$\begin{bmatrix} b_1 \\ b_2 \\ b_3 \\ b_4 \end{bmatrix} = \begin{bmatrix} 0.5 \\ 0 \\ 0.5 \\ 0 \end{bmatrix} + c_1 \begin{bmatrix} -3 \\ 1 \\ 0 \\ 0 \end{bmatrix} + c_2 \begin{bmatrix} 0 \\ 0 \\ -2 \\ 1 \end{bmatrix} \text{ for any } c_1, c_2.$$

5. Under what condition on b_1, b_2, b_3 is this system solvable? Include b as a fourth column in elimination. Find all solutions when that condition holds.

$$\begin{bmatrix} 1 & 2 & -2 & | & b_1 \\ 2 & 5 & -4 & | & b_2 \\ 4 & 9 & -8 & | & b_3 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & -2 & | & b_1 \\ 0 & 1 & 0 & | & b_2 - 2b_1 \\ 0 & 1 & 0 & | & b_3 - 4b_1 \end{bmatrix}$$

$$\begin{bmatrix} 1 & 2 & -2 & | & b_1 \\ 0 & 1 & 0 & | & b_2 - 2b_1 \\ 0 & 0 & 0 & | & b_3 - 4b_1 - b_2 \end{bmatrix}$$

Therefore, $b_3 - b_2 - 4b_1 = 0$, otherwise the system is inconsistent.

pivots = x_1, x_2
 free variables = x_3

Let $x_3 = 0$; then $x_2 = b_2 - 2b_1$ and
 $x_1 = b_1 - 2x_2$
 $= b_1 - 2(b_2 - 2b_1)$
 $= b_1 - 2b_2 + 4b_1$

Homework 6

Jonathan Petersen
A01236750
Oct 8th, 2014

$$= 5b_1 - 2b_2.$$

Therefore, $\underline{x}_p = (5b_1 - 2b_2, b_2 - 2b_1, 0)$.

Let $\underline{x}_3 = 1$; then $\underline{x}_2 = 0$ and

$$\underline{x}_1 = -2(\underline{x}_2) + 2$$

$$= -2(0) + 2$$

$$= 2$$

Therefore, $\underline{x}_n = (2, 0, 1)$.

It then follows that the general solution is:

$$\begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} = \begin{bmatrix} 5b_1 - 2b_2 \\ b_2 - 2b_1 \\ 0 \end{bmatrix} + c \begin{bmatrix} 2 \\ 0 \\ 1 \end{bmatrix} \text{ for all } b, c.$$

7a. Show by elimination that (b_1, b_2, b_3) is in the column space if $b_3 - 2b_2 + 4b_1 = 0$.

$$\begin{bmatrix} 1, & 3, & 1 & | & b_1 \\ 3, & 8, & 2 & | & b_2 \\ 2, & 4, & 0 & | & b_3 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 1 & | & b_1 \\ 0, & 1, & 1 & | & b_2 - 3b_1 \\ 0, & 2, & 2 & | & b_3 - 2b_1 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 3, & 1 & | & b_1 \\ 0, & 1, & 1 & | & b_2 - 3b_1 \\ 0, & 0, & 0 & | & b_3 - 2b_2 + 4b_1 \end{bmatrix}$$

$$\begin{bmatrix} 1, & 2, & 0 & | & -b_2 + b_1 \\ 0, & 1, & 1 & | & b_2 - 3b_1 \\ 0, & 0, & 0 & | & b_3 - 2b_2 + 4b_1 \end{bmatrix}$$

The third row of A shows that $0x + 0y + 0z = b_3 - 2b_2 + 4b_1$, or, in other words, that $b_3 - 2b_2 + 4b_1 = 0$, otherwise the system is inconsistent.

7b. What combination of the rows of A gives the zero row?

The third row minus two times the second row plus four times the first row.

18a. Find by elimination the rank of A and also the rank of A^T :

$$A = \begin{bmatrix} 1, & 4, & 0 \\ 2, & 11, & 5 \\ -1, & 2, & 10 \end{bmatrix}$$

$$A = \begin{bmatrix} 1, & 4, & 0 \\ 0, & 3, & 5 \\ 0, & 6, & 10 \end{bmatrix}$$

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

$$A = \begin{bmatrix} 1 & 4 & 0 \\ 0 & 3 & 5 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\text{pivots} = x_1, x_2$$

$$\text{rank}(A) = 2$$

$$A^T = \begin{bmatrix} 1 & 2 & -1 \\ 4 & 11 & 2 \\ 0 & 5 & 10 \end{bmatrix}$$

$$A^T = \begin{bmatrix} 1 & 2 & -1 \\ 0 & 3 & 6 \\ 0 & 5 & 10 \end{bmatrix}$$

$$A^T = \begin{bmatrix} 1 & 2 & -1 \\ 0 & 3 & 6 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\text{pivots} = x_1, x_2$$

$$\text{rank}(A^T) = 2$$

18b. Find by elimination the rank of A and also the rank of A^T :

$$A = \begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & 2 \\ 1 & 1 & q \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 0 & 1 & q - 1 \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & q - 2 \end{bmatrix}$$

$$\text{pivots} = x_1, x_2. \text{ Also } x_3 \text{ when } q \neq 2.$$

$$\text{rank}(A) = 2 \text{ if } q = 2, \text{ otherwise } 3.$$

$$A^T = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 1 & 2 & q \end{bmatrix}$$

$$A^T = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 1 & q - 1 \end{bmatrix}$$

$$A^T = \begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 1 \\ 0 & 0 & q - 2 \end{bmatrix}$$

$$\text{pivots} = x_1, x_2. \text{ Also } x_3 \text{ if } q \neq 2.$$

$$\text{rank}(A^T) = 2 \text{ if } q = 2, \text{ otherwise } 3.$$

19a. Find the rank of A and also of $A^T(A)$ and also of $A(A^T)$

$$A = \begin{bmatrix} 1 & 1 & 5 \\ 1 & 0 & 1 \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 1 & 5 \\ 0 & 1 & 4 \end{bmatrix}$$

$$\text{rank}(A) = 2$$

$$A^T(A) = \begin{bmatrix} 1 & 1 \\ 1 & 0 \\ 5 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 & 5 \\ 1 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 2 & 1 & 6 \\ 1 & 1 & 5 \\ 6 & 5 & 26 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 0 & 1 \\ 1 & 1 & 5 \\ 1 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 1 & 1 & 5 \\ 0 & 1 & 4 \\ 0 & 0 & 0 \end{bmatrix}$$

$$\text{rank}(A^T(A)) = 2$$

$$A(A^T) = \begin{bmatrix} 1 & 1 & 5 \\ 1 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 & 1 \\ 1 & 0 \\ 5 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 27 & 6 \\ 6 & 2 \end{bmatrix}$$

$$= \begin{bmatrix} 6 & 2 \\ 3 & 4 \end{bmatrix}$$

$$= \begin{bmatrix} 3 & 1 \\ 0 & 3 \end{bmatrix}$$

$$\text{rank}(A(A^T)) = 2$$

19b. Find the rank of A and of $A^T(A)$ and of $A(A^T)$:

$$A = \begin{bmatrix} 2 & 0 \\ 1 & 1 \\ 1 & 2 \end{bmatrix}$$

$$A = \begin{bmatrix} 1 & 0 \\ 0 & 1 \\ 0 & 0 \end{bmatrix}$$

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

$$\text{rank}(A) = 2$$

$$\begin{aligned} A^T(A) &= A = \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & 0 \\ 1 & 1 \\ 1 & 2 \end{bmatrix} \\ &= \begin{bmatrix} 6 & 4 \\ 4 & 6 \end{bmatrix} \\ &= \begin{bmatrix} 3 & 2 \\ 2 & 3 \end{bmatrix} \\ &= \begin{bmatrix} 6 & 4 \\ 0 & 5 \end{bmatrix} \\ &= \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \end{aligned}$$

$$\text{rank}(A^T(A)) = 2$$

$$\begin{aligned} A(A^T) &= \begin{bmatrix} 2 & 0 \\ 1 & 1 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \end{bmatrix} \\ &= \begin{bmatrix} 4 & 2 & 2 \\ 2 & 2 & 3 \\ 2 & 3 & 5 \end{bmatrix} \\ &= \begin{bmatrix} 2 & 1 & 1 \\ 0 & 1 & 2 \\ 0 & 2 & 4 \end{bmatrix} \\ &= \begin{bmatrix} 2 & 0 & -1 \\ 0 & 1 & 2 \\ 0 & 0 & 0 \end{bmatrix} \end{aligned}$$

$$\text{rank}(A(A^T)) = 2$$

23a. Choose the number q so that the ranks are 1.

$$A = \begin{bmatrix} 6 & 4 & 2 \\ -3 & -2 & -1 \\ 9 & 6 & q \end{bmatrix}$$

$$A = \begin{bmatrix} 3 & 2 & 1 \\ 3 & 2 & 1 \\ 9 & 6 & q \end{bmatrix}$$

$$A = \begin{bmatrix} 3 & 2 & q/3 \\ 3 & 2 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

$$A = \begin{bmatrix} 3 & 2 & q/3 \\ 0 & 0 & 1 - q/3 \\ 0 & 0 & 0 \end{bmatrix}$$

If $q = 3$, $\text{rank}(A) = 1$.

$$B = \begin{bmatrix} 3 & 1 & 3 \\ q & 2 & q \end{bmatrix}$$

$$B = \begin{bmatrix} 6 & 2 & 6 \\ q & 2 & q \end{bmatrix}$$

$$B = \begin{bmatrix} 6 & 2 & 6 \\ 6 & 2 & 6 \end{bmatrix}$$

$$B = \begin{bmatrix} 6 & 2 & 6 \\ 0 & 0 & 0 \end{bmatrix}$$

When $q = 6$, $\text{rank}(B) = 1$.

23b. Choose the number q so that the ranks are 2.

$$A = \begin{bmatrix} 3 & 2 & q/3 \\ 0 & 0 & 1 - q/3 \\ 0 & 0 & 0 \end{bmatrix}$$

$$A = \begin{bmatrix} 3 & 2 & q/3 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

$$A = \begin{bmatrix} 3 & 2 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

For all $q \neq 3$, $\text{rank}(A) = 2$.

$$B = \begin{bmatrix} 6 & 2 & 6 \\ q & 2 & q \end{bmatrix}$$

$$B = \begin{bmatrix} 6 & 2 & 6 \\ 0 & 2q - 12 & 0 \end{bmatrix}$$

$$\begin{aligned} 2q &= 12 \\ q &= 6 \end{aligned}$$

For any $q \neq 6$, $\text{rank}(B) = 2$.

23c. Choose the number q so that the ranks are 3.

$$A = \begin{bmatrix} 3 & 2 & 0 \\ 0 & 0 & 1 \\ 0 & 0 & 0 \end{bmatrix}$$

There is no number q such that the $\text{rank}(A) = 3$.

B only has 2 rows, therefore there is no possible value for q such that $\text{rank}(B) > 2$.

Section 3.5

1. Show that v_1, v_2, v_3 are independent, but v_1, v_2, v_3, v_4 are dependent.

$$A = \begin{array}{c} v_1 + v_2 + v_3 \\ \begin{bmatrix} 1, & 1, & 1 \\ 0, & 1, & 1 \\ 0, & 0, & 1 \end{bmatrix} \end{array}$$

$$A = \begin{bmatrix} 1, & 0, & 0 \\ 0, & 1, & 0 \\ 0, & 0, & 1 \end{bmatrix}$$

A has three pivots, and no free variables. As such, $N(A) = 0$, and since the null space of A only contains the zero vector, the columns of A , or v_1, v_2, v_3 , must be linearly independent.

$v_4 = 4v_3 - v_2 - v_1$, therefore v_1, v_2, v_3, v_4 is dependent, since v_4 is a linear combination of the other three vectors.

2. Find the largest possible number of independent vectors among $v_1, v_2, v_3, v_4, v_5, v_6$.

Each vector can explain two of the possible four dimensions, and must explain at least two. The largest possible number of independent vectors in \mathbb{R}^4 is 4, but since all of these vectors have at least two entries there must be at least one entry counted multiple times, so the largest set of linearly independent vectors is $4 - 1 = 3$ vectors. One possible solution is $\{v_1, v_2, v_3\}$.

5a. Decide the dependence or independence of the vectors $(1, 3, 2)$, $(2, 1, 3)$, and $(3, 2, 1)$:

This set of vectors is independent.

5b. Decide the dependence or independence of the vectors $(1, -3, 2)$, $(2, 1, -3)$, and $(-3, 2, 1)$

$$A = \begin{bmatrix} 1, & -3, & 2 \\ 2, & 1, & -3 \\ -3, & 2, & 1 \end{bmatrix}$$

$$A = \begin{bmatrix} 1, & -3, & 2 \\ 0, & 7, & -7 \\ 0, & 7, & -7 \end{bmatrix}$$

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

This set of vectors is dependent.

Homework 6

Jonathan Petersen

A01236750

Oct 8th, 2014

9a. Any four vectors in \mathbb{R}^3 are dependent because:

The number of vectors exceeds the dimension of \mathbb{R}^3 , so the system is overspecified.

9b. The two vectors v_1 and v_2 will be independent if:

They do not lie on the same line. Their span must form a plane.

9c. The vectors v_1 and $(0, 0, 0)$ are dependent because:

Any linear combination of v_1 and the zero vector will be some scalar multiple of v_1 . As a result, inclusion of the zero vector makes any element of the subspace a linear combination of v_1 and $(0, 0, 0)$.

13. Find the dimensions of these four spaces:

- a. The dimension of the column space of $A = 2$.
- b. The dimension of the column space of $U = 2$.
- c. The dimension of the row space of $A = 2$.
- d. The dimension of the row space of $U = 2$.

15. If v_1, \dots, v_n are linearly independent, then the space they span has dimension n . These vectors are a basis for that space. If the vectors are the columns of an m by n matrix, then $m = n$. If $m = n$, that matrix is square.

19. The columns of A are n vectors from \mathbb{R}^m . If they are linearly independent, what is the rank of A ?

The rank of A is n , since no vectors are linear combinations of other vectors there are no free variables.

If they span \mathbb{R}^m , what is the rank?

The rank of A is m , as the vectors explain a change in value for every element of the vector.

If they are a basis for \mathbb{R}^m , what then?

If they are a basis for \mathbb{R}^m , this means that they both span \mathbb{R}^m and are linearly independent. This would imply that the rank of A is equal to n and m , and that $n = m$. A would be a square matrix.

The rank r counts the number of:

Linearly independent columns.
